

①

Interacting Fields : DYSON'S FORMULA

Recall the Schrodinger picture of quantum mechanics :

$$i \frac{d|\psi\rangle_S}{dt} = \hat{H} |\psi\rangle_S$$

States are time dependent, operators are not.

Recall the Heisenberg picture instead :

$$|\psi\rangle_H = e^{i\hat{H}t} |\psi\rangle_S \quad \leftarrow \text{cancels out the time evolution}$$

$$|\psi\rangle_S = e^{-i\hat{H}t} |\psi\rangle_H$$

$$\hat{O}_H(t) = e^{i\hat{H}t} \hat{O}_S e^{-i\hat{H}t}$$

$$\langle\psi| \hat{O}_S |\psi\rangle_S = \langle\psi| \hat{O}_H |\psi\rangle_H$$

States do not evolve in time, operators do.

Now consider the "Interaction Picture" :

Let

$$\hat{H} = \hat{H}_0 + \hat{H}_{int}$$

Then

$$|\psi\rangle_I \equiv e^{i\hat{H}_0 t} |\psi\rangle_S \quad \leftarrow \text{cancels out the evolution in } |\psi\rangle_S \text{ from } \hat{H}_0, \text{ leaving the time evolution associated with } \hat{H}_{int} \text{ only}$$

$$|\psi\rangle_I = e^{-i\hat{H}_{int} t} |\psi\rangle_H$$

and

$$\hat{O}_I(t) = e^{i\hat{H}_0 t} \hat{O}_S e^{-i\hat{H}_0 t}$$

time independent

← evolves according to \hat{H}_0

$$\langle\psi| \hat{O}_S |\psi\rangle_S = \underbrace{\langle\psi|}_{\equiv \langle\psi|_I} e^{-i\hat{H}_0 t} e^{i\hat{H}_0 t} \underbrace{\hat{O}_S}_{\hat{O}_I} e^{-i\hat{H}_0 t} e^{i\hat{H}_0 t} |\psi\rangle_S = \langle\psi|_I \hat{O}_I |\psi\rangle_I$$

(2)

We can derive the Schrodinger-like equation for $|\psi\rangle_I$:

Begin with the Schrodinger equation

$$i \frac{d|\psi\rangle_S}{dt} = \hat{H} |\psi\rangle_S$$

Substitute

$$|\psi\rangle_S = e^{-i\hat{H}_0 t} |\psi\rangle_I$$

for $|\psi\rangle_S$, we obtain

$$i \frac{d}{dt} (e^{-i\hat{H}_0 t} |\psi\rangle_I) = (\hat{H}_0 + \hat{H}_{int}) e^{-i\hat{H}_0 t} |\psi\rangle_I$$

Expand out the left-hand side

$$\begin{aligned} i \frac{d}{dt} (e^{-i\hat{H}_0 t} |\psi\rangle_I) &= i e^{-i\hat{H}_0 t} \frac{d}{dt} |\psi\rangle_I + i(-i\hat{H}_0) e^{-i\hat{H}_0 t} |\psi\rangle_I \\ &= i e^{-i\hat{H}_0 t} \frac{d}{dt} |\psi\rangle_I + \hat{H}_0 e^{-i\hat{H}_0 t} |\psi\rangle_I \\ &= i e^{-i\hat{H}_0 t} \frac{d}{dt} |\psi\rangle_I + \hat{H}_0 |\psi\rangle_S \end{aligned}$$

Now consider the right-hand side

$$(\hat{H}_0 + \hat{H}_{int}) e^{-i\hat{H}_0 t} |\psi\rangle_I = \hat{H}_0 e^{-i\hat{H}_0 t} |\psi\rangle_I + \hat{H}_{int} e^{-i\hat{H}_0 t} |\psi\rangle_I$$

(3)

$$= \hat{H}_0 |\psi\rangle_S + \hat{H}_{INT} e^{-i\hat{H}_0 t} |\psi\rangle_I$$

Equating the two sides and ignoring the common term, $\hat{H}_0 |\psi\rangle_S$, we have

$$i e^{-i\hat{H}_0 t} \frac{d|\psi\rangle_I}{dt} = \hat{H}_{INT} e^{-i\hat{H}_0 t} |\psi\rangle_I$$

or

$$\begin{aligned} i \frac{d|\psi\rangle_I}{dt} &= e^{i\hat{H}_0 t} \hat{H}_{INT} e^{-i\hat{H}_0 t} |\psi\rangle_I \\ &\equiv \hat{H}_I(t) |\psi\rangle_I \end{aligned}$$

where $\hat{H}_I(t)$ is defined to be \hat{H}_{INT} in the interaction picture - i.e.,

$$\hat{H}_I(t) \equiv e^{i\hat{H}_0 t} \hat{H}_{INT} e^{-i\hat{H}_0 t}$$

So, we have

$$\frac{d|\psi\rangle_I}{dt} = -i \hat{H}_I(t) |\psi\rangle_I$$

To obtain the corresponding integral equation, integrate both sides with respect to t , from some initial time t_0 to t , to obtain

$$\int_{t_0}^t \frac{d|\psi\rangle_I}{dt'} dt' = |\psi\rangle_I(t) - |\psi\rangle_I(t_0) = -i \int_{t_0}^t \hat{H}_I(t') |\psi\rangle_I(t') dt'$$

Rearranging, we get

$$|\psi\rangle_I(t) = |\psi\rangle_I(t_0) - i \int_{t_0}^t \hat{H}_I(t') |\psi\rangle_I(t') dt'$$

Substituting the above equation for $|\psi\rangle_I(t')$ in the above integral yields

$$|\psi\rangle_I(t) = |\psi\rangle_I(t_0) - i \int_{t_0}^t \hat{H}_I(t') \left[|\psi\rangle_I(t_0) - i \int_{t_0}^{t'} \hat{H}_I(t'') |\psi\rangle_I(t'') dt'' \right] dt'$$

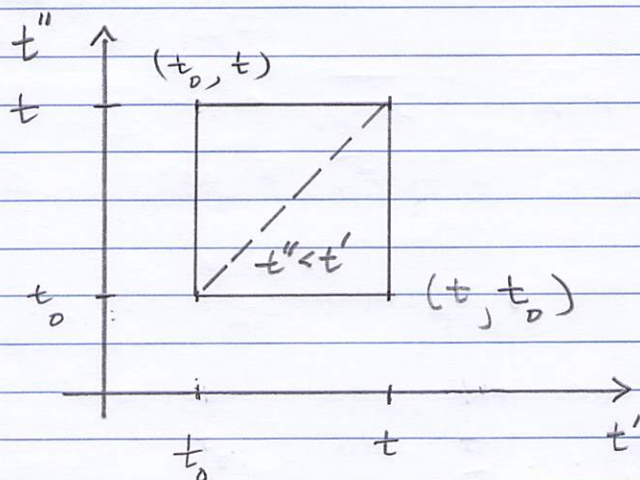

Do this again

$$\begin{aligned} |\psi\rangle_I(t) &= |\psi\rangle_I(t_0) \\ &- i \int_{t_0}^t \hat{H}_I(t') dt' |\psi\rangle_I(t_0) \\ &+ (i)^2 \int_{t_0}^t \hat{H}_I(t') \int_{t_0}^{t'} \hat{H}_I(t'') \left[|\psi\rangle_I(t_0) - i \int_{t_0}^{t''} \hat{H}_I(t''') |\psi\rangle_I(t''') dt''' \right] dt'' dt' \\ &= \left\{ 1 - i \int_{t_0}^t dt' \hat{H}_I(t') \right. \\ &\quad + (i)^2 \int_{t_0}^t dt' \int_{t_0}^{t'} dt'' \hat{H}_I(t') \hat{H}_I(t'') \\ &\quad \left. - \dots \right\} |\psi\rangle_I(t_0) \end{aligned}$$

Now consider

$$\int_{t_0}^t \int_{t_0}^{t'} dt' dt'' \hat{H}_{\text{I}}(t') \hat{H}_{\text{I}}(t'')$$

and note that $t' > t''$. Consider the integration domain in the (t', t'') plane:

Now also consider

$$\mathcal{T} \{ \hat{H}_{\text{I}}(t') \hat{H}_{\text{I}}(t'') \} = \begin{cases} \hat{H}_{\text{I}}(t') \hat{H}_{\text{I}}(t'') & t'' < t' \\ \hat{H}_{\text{I}}(t'') \hat{H}_{\text{I}}(t') & t'' > t' \end{cases}$$

↑ nothing changes if $t' \leftrightarrow t''$

But

$$\mathcal{T} \{ \hat{H}_{\text{I}}(t') \hat{H}_{\text{I}}(t'') \} = \mathcal{T} \{ \hat{H}_{\text{I}}(t'') \hat{H}_{\text{I}}(t') \}$$

Then

$$t' = t''$$

This is just the integral of $T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$ in the lower half triangle. (6)

$$\int_{t_0}^t dt' \int_{t_0}^{t'} dt'' \hat{H}_I(t') \hat{H}_I(t'') = \frac{1}{2} \int_{t_0}^t dt' \int_{t_0}^t dt'' T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$$

and

$$|\psi\rangle_I(t) = \left\{ 1 - i \int_{t_0}^t dt' \hat{H}_I(t') \right.$$

$$+ (i)^2 \int_{t_0}^t dt' \int_{t_0}^{t'} dt'' T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$$

$$- \dots \left. \right\} |\psi\rangle_I(t_0)$$

$$= T \left\{ e^{-i \int_{t_0}^t dt' \hat{H}_I(t')} \right\} |\psi\rangle_I(t_0)$$

LYSON'S
FORMULA

$$\equiv \hat{U}(t, t_0) |\psi\rangle_I(t_0)$$

The S-Matrix Operator is defined in terms of $\hat{U}(t, t_0)$

$$\langle f | \hat{S} | i \rangle \equiv \lim_{\substack{t_f \rightarrow -\infty \\ t_i \rightarrow +\infty}} \langle f | \hat{U}(t_f, t_i) | i \rangle$$

Note that the states $|i\rangle$ and $|f\rangle$ are typically time-independent eigenstates of $\hat{H}_0(t)$.

We will assume that as $t \rightarrow \pm\infty$, $\hat{H}_I(t) \rightarrow 0$.

When $\hat{H}_I(t) = 0$,

CLAIM

$$\int_{t_0}^t dt' \int_{t_0}^{t'} dt'' \hat{H}_I(t') \hat{H}_I(t'')$$

$$= \frac{1}{2} \int_{t_0}^t dt' \int_{t_0}^t dt'' T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$$

PROOF

$$\int_{t_0}^t dt' \int_{t_0}^{t'} dt'' \hat{H}_I(t') \hat{H}_I(t'')$$

The integrands are equal for $t' > t''$ - i.e., in the lower triangle.

$$= \int_{t_0}^t dt' \int_{t_0}^{t'} dt'' T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$$

The integrand is equal to itself in the upper triangle.

$$= \frac{1}{2} \int_{t_0}^t dt' \int_{t_0}^t dt'' T \{ \hat{H}_I(t') \hat{H}_I(t'') \}$$

(7)

$$|\psi\rangle_H = e^{i\hat{H}t} |\psi\rangle_S$$

$$\leftarrow \text{INVERSE OF } |\psi\rangle_S = e^{-i\hat{H}t} |\psi\rangle_H$$

↑
t-independent

$$= e^{i\hat{H}_I t} e^{i\hat{H}_0 t} |\psi\rangle_S$$

$$= e^{i\hat{H}_I t} |\psi\rangle_I$$

$$= |\psi\rangle_I$$

Also, when $\hat{H}_I(t) = 0$,

$$\hat{H}(t) = \hat{H}_0(t) + \hat{H}_I(t)$$

$$= \hat{H}_0(t)$$

and

$$|\psi\rangle_S = e^{-i\hat{H}_0 t} |\psi\rangle_H$$

$$= e^{-i\hat{H}_0 t} |\psi\rangle_I$$

or

$$\langle f | \hat{S} | i \rangle = \langle f | T \left\{ e^{-i \int_{-\infty}^{\infty} dt \hat{H}_I(t)} \right\} | i \rangle$$

$$= \langle f | T \left\{ e^{-i \int dx \hat{H}_I(x)} \right\} | i \rangle$$

Where we have expressed the interaction Hamiltonian in terms of the interaction Hamiltonian density

One last, but very important, thing:

What fields are used in $\hat{\mathcal{H}}_{\text{I}}(x)$?

Recall that for a general operator $\hat{O}(t)$

$$\hat{O}_{\text{H}}(t) = e^{i\hat{H}t} \hat{O}_{\text{S}} e^{-i\hat{H}t}$$

$$\hat{O}_{\text{I}}(t) = e^{i\hat{H}_0 t} \hat{O}_{\text{S}} e^{-i\hat{H}_0 t}$$

This is true for $\hat{\phi}(x)$. That is

$$\rightarrow \hat{\phi}_{\text{H}}(\vec{x}, t) = e^{i\hat{H}t} \hat{\phi}(\vec{x}, 0) e^{-i\hat{H}t}$$

$$\hat{\phi}_{\text{S}}(\vec{x}) \equiv \hat{\phi}(\vec{x}, 0)$$

Technically
just $\hat{\phi}(\vec{x}, t)$.

$$\hat{\phi}_{\text{I}}(\vec{x}, t) = e^{i\hat{H}_0 t} \hat{\phi}(\vec{x}, 0) e^{-i\hat{H}_0 t}$$

Then, at $t=0$

$$\hat{\phi}_{\text{H}}(\vec{x}, 0) = \hat{\phi}_{\text{I}}(\vec{x}, 0) = \hat{\phi}_{\text{S}}(\vec{x})$$

all three pictures
agree

Since

$$\hat{\mathcal{H}}_{\text{I}}(x) = \hat{\mathcal{H}}_{\text{I}}[\hat{\phi}_{\text{H}}(x)]$$

(9)

$$\begin{aligned}\hat{\mathcal{H}}_{\text{I}}(\vec{x}, 0) &= \hat{\mathcal{H}}[\hat{\phi}_{\text{H}}(\vec{x}, 0)] \\ &= \hat{\mathcal{H}}[\hat{\phi}_{\text{I}}(\vec{x}, 0)]\end{aligned}$$

But

$$\begin{aligned}\hat{\mathcal{H}}_{\text{I}}(x) &= e^{i\hat{H}_0 t} \hat{\mathcal{H}}_{\text{I}}(\vec{x}, 0) e^{-i\hat{H}_0 t} \\ &= e^{i\hat{H}_0 t} \hat{\mathcal{H}}_{\text{I}}[\hat{\phi}_{\text{I}}(\vec{x}, 0)] e^{-i\hat{H}_0 t} \\ &= \hat{\mathcal{H}}_{\text{I}}[\hat{\phi}_{\text{I}}(x)]\end{aligned}$$

That is, $\hat{\mathcal{H}}_{\text{I}}$ is a function of the field operators in the interaction representation.

But $\hat{\phi}_{\text{I}}(x)$ evolve according to \hat{H}_0 !

There are nothing other than the free fields!

So, finally

$$\langle s | \hat{S} | i \rangle = \langle s | T \left\{ e^{-i \int d^4 x \hat{\mathcal{H}}_{\text{I}}[\hat{\phi}_{\text{I}}(x)]} \right\} | i \rangle$$
